

GoldMedia Online - Keyword Intelligence Pipeline

Google Ads API Tool Description (Basic Access Application, Aug 2026)

1. Overview

GoldMedia Online develops an internal keyword intelligence pipeline for an e-commerce vertical: a Shopify store selling magnesium glycinate supplements, targeting the US market.

The tool consolidates keyword data from multiple third-party SEO sources into a local PostgreSQL database and validates them against the ground truth provided by the Google Ads API.

Purpose of this application: read-only access via KeywordPlanIdeaService to obtain search volume, competition level, and bid estimates for the store's semantic core (thousands of keywords).

2. How the tool uses the API

1. The tool issues GenerateKeywordIdeas requests with up to 20 seed keywords per call (keyword_seed type, en-US, geo-level targeting).
2. Each response is normalized, deduplicated, and stored in raw_rows with full metadata (avg_monthly_searches, monthly volumes, competition, top-of-page bids).
3. Stored data is verified against third-party SEO resellers: exact-match ratios, coverage, and overlap scores are computed to rank source quality.
4. Results feed the semantic core used for product page (PDP) content and informational articles.

3. API scope

Used services: KeywordPlanIdeaService.generate_keyword_ideas only.

No write operations, no campaign mutation, no conversion tracking, no remarketing calls.

Access type: basic access level; expected volume is well under default developer token quotas.

4. Intended audience

Internal users only: the sole proprietor (individual entrepreneur, RU) and their own e-commerce workflow. No external or public usage.

5. Compliance

The tool stores no end-user personal data. All data is keyword research metrics.

Quotas and policy are respected; no scraping or circumvention of API limits.
